

Windows XP users 6 Times more likely to be hacked

As you might have read recently in several article such as in USA Today, <http://www.usatoday.com/story/cybertruth/2013/10/29/windows-xp-users-six-times-more-likely-to-be-hacked/3287615/>, the exploits, infection rate and data exposures have increased significantly on customers still using Windows XP. I am sure you are aware that the **end of life for Windows XP** is coming upon us quickly – **8 Apr 2014**, at which point no further security updates, patches or fixes will be available (without a signed Custom Support Agreement). Please let us know if there is anything we can to assist you in migrating your remaining XP clients to a modern, secure operating system.
